

# Music Player Project

## Introduction

Create a front-end project that simulates the web interface of a music player (think Spotify).

## Features

- Show a list of available songs (title, artist, duration). The list can be hard-coded client side.
- Show a *Play/Pause* button and highlight the song in the list when it's selected
- Display the remaining duration of the currently playing song in real time

## What we are looking for

- Code quality and structure
- Consideration of UI/UX

## Technical requirements:

- There are no requirements for the tech stack. Vanilla JavaScript is fine, as is any framework that you feel is appropriate.
- There's no need to play any audio file... but if you think that you have great taste in music feel free to show us ;-)
- Try and spend no more than 4 hours on it!
